# From Technical Support to DevOps

## An Engineer's Transformation Journey

Volodymyr Maksymets

Senior Technical Support Engineer (L3) → Trainee DevOps/SRE/DevSecOps

# Where I Am Now

**Senior Technical Support Engineer (L3) • HostPro • 3.5+ years**

### Linux Administration

CentOS, AlmaLinux, Ubuntu, Debian, CloudLinux, RockyLinux

### Web & Networking

Nginx, Apache, LiteSpeed, DNS (PowerDNS), HTTP protocols

### Databases

MySQL, Percona, MariaDB — optimization & diagnostics

### Automation

Bash scripts for log analysis, backups, routine maintenance

### Monitoring

Prometheus + Grafana — deployed to production with zero downtime

### Troubleshooting

Tier 3 incidents, high-load diagnostics, migrations

*Current approach: reactive troubleshooting — fix what's already broken*

# What is DevOps?

*"DevOps is not a job title or a toolset — it's an engineering philosophy and mindset"*

### Shared Responsibility

Dev + Ops = one team. No more 'it works on my machine'

### Total Automation

If you do it twice manually — automate it. No exceptions

### CI/CD Pipelines

GitLab CI, GitHub Actions → Docker → Argo CD. Deploy without downtime

### One Source of Truth

Everything in Git. No manual changes on production via SSH

### Communication

DevOps engineer bridges the gap between Dev, Ops, and Business

Based on the lecture of April 8, 2026

# My Journey: Support → DevOps

## What I Bring

Strengths from 3.5+ years in L3 Support

- Troubleshooting mindset — diagnosing complex issues under pressure
- Deep understanding of how systems behave under high load
- Production experience: Prometheus, Grafana, PowerDNS at scale
- Client-oriented thinking — balancing tech constraints & business needs
- Mentoring junior engineers

## What I Need to Learn

The paradigm shift from reactive to proactive

- Infrastructure as Code (Terraform, Ansible) — no more SSH fixes
- CI/CD pipelines (GitLab CI, GitHub Actions, Argo CD)
- Containerization & orchestration (Docker, Kubernetes)
- GitOps practices — Git as the single source of truth
- Proactive system design vs. reactive incident response

*Key challenge: shifting from "fix what's broken" to "build so it doesn't break"*

# The Transformation: Support → DevOps

*"Support Never Sleeps"*

*"Build • Measure • Elevate"*

# My Priority Direction

## SRE / Monitoring

- Prometheus + Grafana — already deployed in production
- From metrics → to full Observability
- SLI / SLO / Error Budgets
- Automated alert response

## DevSecOps / Security

- Master's degree in Cybersecurity
- Least Privilege principle
- SAST, DAST, Secret Detection in CI/CD
- Security by Design

*Two vectors, one goal: resilient, secure, automated infrastructure*

# Conclusion

- L3 Tech Support background = deep infrastructure understanding + strong troubleshooting mindset
- Key challenge: shifting from reactive manual administration to proactive declarative IaC
- Priority vectors: SRE/Monitoring + DevSecOps — a natural extension of experience & education
- Goal: build resilient systems, not just fix broken ones
